An **enumeration**(enum) is a user-defined data type that consists of integral constants. It helps assign meaningful names to a set of integer values, improving code readability.

Defining an Enumeration

```
#include <stdio.h>

enum Day { Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday };

int main() {
    enum Day today = Wednesday;

    printf("Today is day number %d\n", today);  // Output: Today is day number 3

    return 0;
}
```
