1.2 Reading from Files

To read data from a file, C provides several functions, such as `fgetc()`, `fgets()`, and `fread()`.

- **fgetc()** : Reads a single character from the file.

```
int ch = fgetc(file);

if (ch != EOF) {

    printf("Character: %c\n", ch);

}
```

- **fgets()** : Reads a line (up to a specified number of characters) from a file into a string.

```
char buffer[100];

fgets(buffer, sizeof(buffer), file);

printf("Line: %s\n", buffer);
```

- **fread()** : Reads data into a buffer from a file, useful for reading binary files.
