The `perror()` function provides a system-generated error message, which helps in diagnosing the issue.

3.2 Checking for Read and Write Errors

When performing read or write operations, you can check if an error has occurred by using the `ferror()` function. This function returns a non-zero value if an error occurs.

```
if (ferror(file)) {
    printf("Error reading the file.\n");
    clearerr(file);  // Clears the error indicator
}
```

3.3 Checking for End-of-File (EOF)

When reading from a file, you need to be aware of the end-of-file (EOF) marker. If `fgetc()` or `fgets()` reaches the end of the file, it returns `EOF` or `NULL`, respectively. Always check for this condition to avoid reading beyond the file content.

```
int ch = fgetc(file);
if (ch == EOF) {
    printf("End of file reached or error occurred.\n");
```
