`>>` **(Right Shift)**: Shifts the bits of a number to the right by a specified number of positions. This is equivalent to dividing the number by 2 raised to the power of the number of shifts.

```
5 >> 1  // Result is 2 (0101 >> 1 = 0010)
```

-

9.2.2 Applications of Bitwise Operations

Bitwise operations are often used in scenarios that involve flags, such as setting or clearing bits in a bitmask. For example:

Setting a bit (turning it to 1):

```
num |= (1 << pos);  // Set the bit at 'pos' position.
```

-

Clearing a bit (turning it to 0):

```
num &= ~(1 << pos);  // Clear the bit at 'pos' position.
```

-

Toggling a bit (inverting its value):

```
num ^= (1 << pos);  // Toggle the bit at 'pos' position.
```
