`BookController` class responsible for handling HTTP requests sent to the `/books` base endpoint.

Listing 3.10 Defining handlers for REST endpoints

```
package com.polarbookshop.catalogservice.web;

import com.polarbookshop.catalogservice.domain.Book;
import com.polarbookshop.catalogservice.domain.BookService;
import org.springframework.http.HttpStatus;
import org.springframework.web.bind.annotation.*;

@RestController                                                    ❶
@RequestMapping("books")                                           ❷
public class BookController {
  private final BookService bookService;

  public BookController(BookService bookService) {
    this.bookService = bookService;
  }

  @GetMapping                                                      ❸
  public Iterable<Book> get() {
    return bookService.viewBookList();
  }

  @GetMapping("{isbn}")                                            ❹
  public Book getByIsbn(@PathVariable String isbn) {               ❺
    return bookService.viewBookDetails(isbn);
  }

  @PostMapping                                                     ❻
  @ResponseStatus(HttpStatus.CREATED)                              ❼
  public Book post(@RequestBody Book book) {                       ❽
    return bookService.addBookToCatalog(book);
  }

  @DeleteMapping("{isbn}")                                         ❾
  @ResponseStatus(HttpStatus.NO_CONTENT)                           ❿
  public void delete(@PathVariable String isbn) {
    bookService.removeBookFromCatalog(isbn);
  }

  @PutMapping("{isbn}")
  public Book put(@PathVariable String isbn, @RequestBody Book book) {
    return bookService.editBookDetails(isbn, book);
```
