```
    extendsFrom annotationProcessor
  }
 }

dependencies {
  ...
  annotationProcessor
  ➥ 'org.springframework.boot:spring-boot-configuration-processor'
}
```

❶ Configures Gradle to use the Configuration Processor when building the project

Now you can trigger the metadata generation by building your project (`./gradlew clean build`). At this point you can go ahead and define a default value for the `polar.greeting` property in the application.yml file. While you are inserting the new property, your IDE should provide you with an autocompletion option and type check, as shown in figure 4.4.

Listing 4.4 Defining a value for a custom property in Catalog Service

```
polar:
  greeting: Welcome to the local book catalog!
```
