

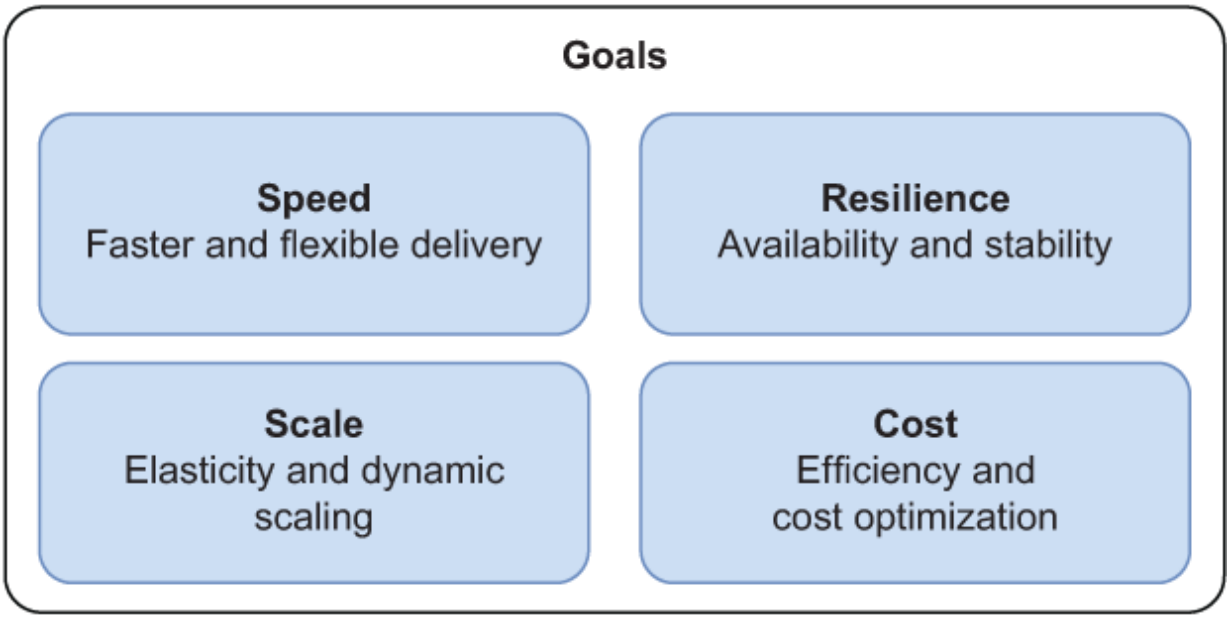

Figure 1.8 Going cloud native can help you meet several goals related to speed, resilience, scale, and cost optimization.

1.5.1 Speed

Being able to deliver software faster is an important goal for enterprises nowadays. Bringing ideas into production as quickly as possible, therefore reducing the time to market, is a critical competitive advantage. Going to production with the right idea at the right time might make the difference between success and failure.

Customers expect to have more and more features implemented or bugs fixed, and they want them now. They will not be happy to wait six months for the next release of your software. Their expectations keep increasing, and you need a way to keep up with them. In the end, it’s all about providing value to customers and ensuring they are satisfied with the results. Otherwise, your business will not survive the fierce competition out there.
