reactive applications. In the Order Service project (order-service), open the build.gradle file, and add the new dependency. Remember to refresh or reimport the Gradle dependencies after the new addition.

Listing 12.16 Adding dependency for Spring Security OAuth2 Resource Server

```
dependencies {
  ...
  implementation 'org.springframework.boot:
  ➥ spring-boot-starter-oauth2-resource-server'
}
```

Next we'll configure the integration between Spring Security and Keycloak.

CONFIGURING THE INTEGRATION BETWEEN SPRING SECURITY AND KEYCLOAK

The strategy for integrating Spring Security with Keycloak will be similar to what we did in Catalog Service. Open the Order Service project (order-service), and update the application.yml file with the following configuration.

Listing 12.17 Configuring Order Service as an OAuth2 Resource Server

```
spring:
  security:
    oauth2:
      resourceserver:
        jwt:                                          ❶
          issuer-uri:
➥http://localhost:8080/realms/PolarBookshop          ❷
```

❶ OAuth2 doesn't enforce a data format for Access Tokens, so we must be explicit about our choice. In this case, we want to use JWT.

❷ The Keycloak URL providing information about all the relevant OAuth2 endpoints for the specific realm
