When it’s not available, Order Service will keep working correctly, but with graceful functionality degradation.

Let’s consider another example. Edge Service depends on Redis for storing and retrieving web session data. Should you include it in the readiness probe? Since Edge Service can’t process any new requests without accessing Redis, including Redis in the readiness probe might be a good idea. Spring Boot Actuator will consider both the internal state of the application and the integration with Redis to determine whether the application is ready to accept new requests.

In the Edge Service project (edge-service), open the application.yml file, and define which indicators to use in the readiness probe: the application standard readiness state and the Redis health status. I’ll assume you have already added Spring Boot Actuator to Edge Service and configured the health endpoints as described earlier.

Listing 13.10 Including Redis in the computation of the readiness state

```
management:
  endpoints:
    web:
      exposure:
        include: health
  endpoint:
    health:
      show-details: always
      show-components: always
      probes:
        enabled: true
      group:
        readiness:
          include: readinessState,redis      ❶
```

❶ The readiness probe will combine the application’s readiness state and Redis’s availability.
