❶ Enables Java information in the info endpoint

❷ Enables OS information in the info endpoint

Let's test it out. Rerun Catalog Service (`./gradlew bootRun`). Then invoke the info endpoint:

```
$ http :9001/actuator/info
```

The result now includes additional information about the Java version and operating system in use, which will be different depending on where you run the application:

```
{
  ...
  "java": {
    "version": "17.0.3",
    "vendor": {
      "name": "Eclipse Adoptium",
      "version": "Temurin-17.0.3+7"
    },
    "runtime": {
      "name": "OpenJDK Runtime Environment",
      "version": "17.0.3+7"
    },
    "jvm": {
      "name": "OpenJDK 64-Bit Server VM",
      "vendor": "Eclipse Adoptium",
      "version": "17.0.3+7"
    }
  },
  "os": {
    "name": "Mac OS X",
    "version": "12.3.1",
    "arch": "aarch64"
  }
}
```

13.5.3 Generating and analyzing heap dumps

Among the most annoying errors to debug in Java applications, memory leaks are probably the first that come to mind. Monitoring tools should alert
