```
$ kubectl create secret generic \              ❶
    test-credentials \                         ❷
    --from-literal=test.username=user \        ❸
    --from-literal=test.password=password      ❹
```

❶ Creates a generic secret with Base64-encoded values

❷ The name of the Secret

❸ Adds a secret value for the test username

❹ Adds a secret value for the test password

We can verify that the Secret has been created successfully with the following command:

```
$ kubectl get secret test-credentials

NAME               TYPE     DATA   AGE
test-credentials   Opaque   2      73s
```

We can also retrieve the internal representation of the Secret in the familiar YAML format with the following command:

```
$ kubectl get secret test-credentials -o yaml

apiVersion: v1                 ❶
kind: Secret                   ❷
metadata:
  name: test-credentials       ❸
type: Opaque
data:                          ❹
  test.username: dXNlcg==
  test.password: cGFzc3dvcmQ=
```

❶ The API version for Secret objects

❷ The type of object to create

❸ The name of the Secret

❹ Section containing the secret data with Base64-encoded values
