

Figure 3.23 Each <g> element has its own set of paths cloned as child nodes, resulting in football icons overlaid on each element.

Loading elements from external data sources like this is useful if you want to move individual nodes out of your loaded document fragment, but if you want to bind the externally loaded SVG elements to data, it's an added step that you can skip. We can't set the `.html()` of a `<g>` element to the text of our incoming elements like we did with the `<div>` when we populated it with the contents of modal.html. That's because SVG doesn't have a corresponding property to innerHTML, and therefore the `.html()` function on a selection of SVG elements has no effect. Instead, we have to clone the paths and append them to each `<g>` element representing our teams:

```
d3.html("resources/icon_1907.svg", loadSVG);
function loadSVG(svgData) {
    d3.selectAll("g").each(function() {
    var gParent = this;
    d3.select(svgData).selectAll("path").each(function() {
          gParent.appendChild(this.cloneNode(true))
      });
    });
};
```

It may seem backwards to select each `<g>` and then select each loaded `<path>`, until you think about how `.cloneNode()` and `.appendChild()` work. We need to take each `<g>` element and go through the `<path>`-cloning process for every path in the loaded icon, which means we use nested `.each()` statements (one for each `<g>` element in our DOM and one for each `<path>` element in the icon). By setting `gParent` to the actual `<g>` node (the `this` variable), we can then append a cloned version of each path in order. The results are soccer balls for each team, as shown in figure 3.23.

We can easily do the same thing using the `<image>` syntax from the first example in this section, but with our SVG elements individually added to each. And now we can style them in the same way as any path element. We could use the national colors for each ball, but we'll settle for making them red, with the results shown in figure 3.24.

```
d3.selectAll("path").style("fill", "darkred")
.style("stroke", "black").style("stroke-width", "1px");
```
