```
    .fontSize(function(d) { return wordScale(d.frequency); })
    .on("end", draw)
    .start();
```

At this point, we have your traditional word cloud (figure 5.29), and we can tweak the settings and colors to create anything you've seen on Wordle. But now let's take a look at why word clouds get such a bad reputation. We've taken an interesting dataset, the most common words in this chapter, and, other than size them by their frequency, done little more than place them on screen and jostle them a bit. We have different channels for expressing data visually, and in this case the best channels that we have, besides size, are color and rotation.

With that in mind, let's imagine that we have a keyword list for this book, and that each of these words is in a glossary in the back of the book. We'll place those keywords
