

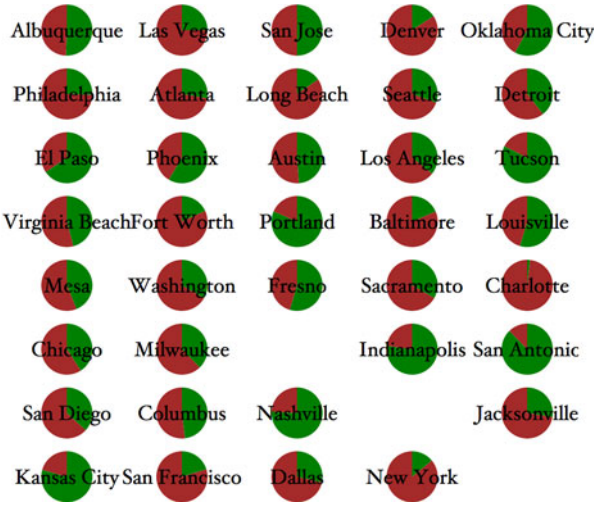

Figure 1.2 D3 can be used for simple charts, such as this set of multiple pie charts (explained in chapter 5) used to represent the differences in the use of language about nature in major US city planning (from the City Nature project at citynature.stanford.edu). Each pie shows the ratio of language referring to parks and open space (green) versus habitat (red) in city plans.

graphics for traditional charting, but also the creation of geospatial and network visualizations, as well as traditional HTML elements like tables, lists, and paragraphs. This broad-based approach to data visualization, where a map or a network graph or a table is just another kind of representation of data, is the core of the D3.js library's appeal for application development.

Figures 1.2 through 1.8 show data visualization pieces that I've created with D3. They include maps and networks, along with more traditional pie charts and completely custom data visualization layouts based on the specific needs of my clients.

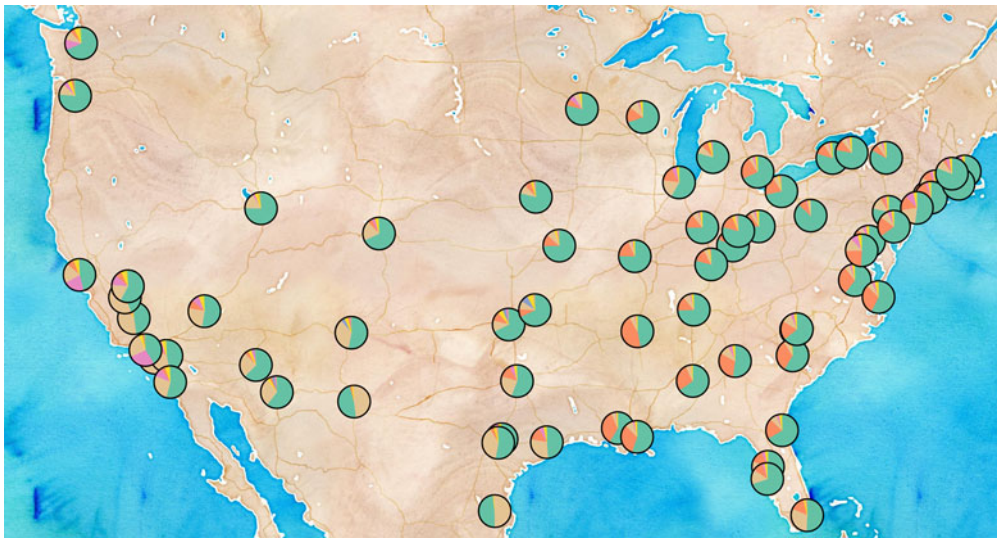

Figure 1.3 D3 can also be used to create web maps (see chapter 7), such as this map showing the ethnic makeup of major metropolitan areas in the United States.
