Figure 3.1 This landscape diagram of the Messflix architecture depicts Messflix internal systems, external data sources, teams, and users.

You will notice that, remaining loyal to the Messflix name, the current setup is rather *complicated*. That's one of the reasons a data mesh may just be the tool required to untangle this mess.

You take the following four steps to develop a system and development team landscape diagram:

1. You start with whitespace (whiteboard, piece of paper, or digital whiteboard) and place the internal IT systems and the external systems used by users or internal systems.
2. You add all the other actors interacting with systems to your working space.
3. You order the system and user indicators (sticky notes, shapes) and draw arrows indicating interactions between the collected elements.
4. You decide that to help you with the implementation team selection, the landscape needs to be enhanced with an additional element not usually present in such a diagram: you add teams responsible for the development and maintenance of all IT systems.

We will use this landscape, summarized in table 3.1, to decide on an MVP environment. Later, we will fill in the table as we discover the pros and cons of engaging each team.

Table 3.1 MVP environment selection sheet

System	Users	Development team(s)	MVP pros	MVP cons
Hitchcock Movie Maker (Production-specific data storage)	Messflix production team Screenwriters	Orange team White team
