Besides being very smart about the up-front split of platform capabilities, is there anything you can do to deal with this situation? Yes! Your team can choose to phase out some parts of the interface. To phase out any platform elements, your team should take the following steps:

1. Create the nonbreaking change.
2. Incentivize users to adopt the new interface functionality.
3. Track adoption of the old interface functionality, both on the production and on the consumption side.
4. Keep the parallel approach running for a long grace period.
5. Once the tracking shows that the old functionality is not needed anymore, set a deadline for deprecation, communicate it to the producers and consumers, and switch out the old functionality.

The basic idea behind this step-by-step process is that the new functionality should be much better than the old one. If both data producers and consumers truly have a much better life with the new functionality, they should stop using the old one at that point.
