

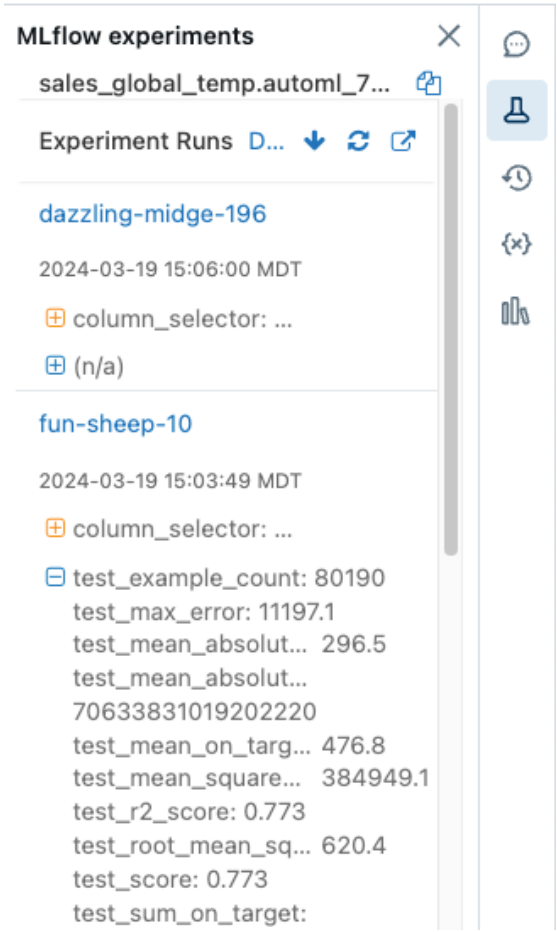

Figure 6.2 – The in-notebook user interface for viewing the experiment runs

In MLflow Tracking lingo, the execution of data science modeling code is called a "run." Each run can record the following:

- **Parameters**: Key-value pairs of input parameters, such as the features used for a given run or the number of trees in a random forest.
- **Metrics**: Evaluation metrics such as RMSE or Area Under the ROC Curve.
- **Artifacts**: Arbitrary output files in any format. This can include images, pickled models, and data files.
- **Source**: The code that originally ran the experiment and a reference to the exact version of the data used for training.
