Integrating data via the Marketplace

Databricks Marketplace is an open market for data, analytics, and AI artifacts. Organizations can provide and consume available artifacts to augment their internal projects. Companies can leverage this built-in ability to share, sell, or purchase data, notebooks, and models. Imagine you have a lot of data on shipping logistics, and you want to improve the accuracy of your shipping time predictions. You have a working model that does a decent job, and you have exhausted your internal data resources. However, you find a weather data set while exploring Databricks Marketplace, which might provide some interesting benefits! Let's walk through the process of getting our hands on that data.

1. Open the **Marketplace** inside of Databricks (accessible via the left-hand navigation bar). The landing page looks something like *Figure 6.3*.

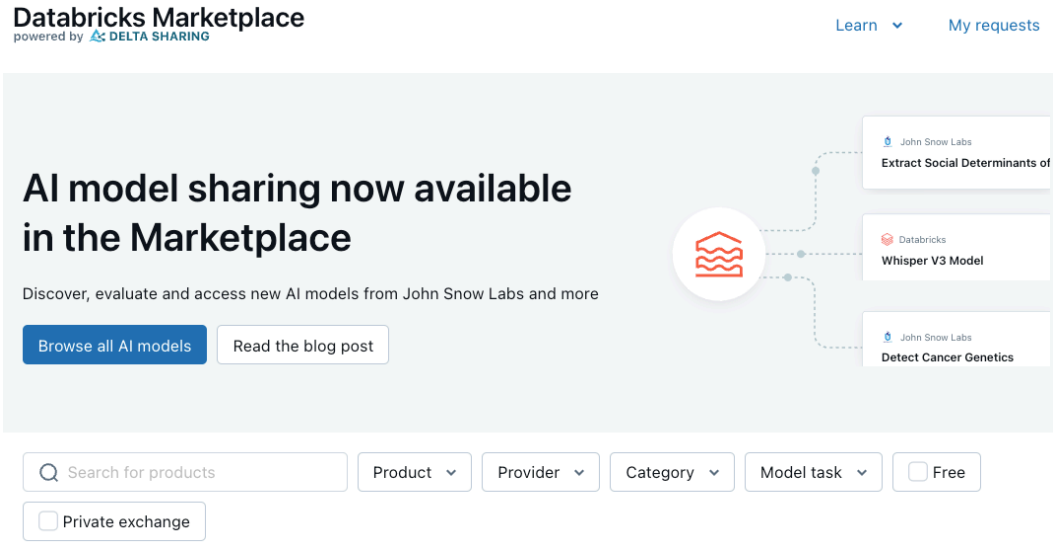

Figure 6.3 – The Databricks Marketplace landing page

2. Navigate to *Historical Weather Data - U.S. Postal Codes Sample* by searching for Weather Data in the Search for products box. When you reach the search page select the **Free** filter option.
3. Click the **Get instant access** button in the upper-right hand corner of the page to install the dataset in Unity Catalog and make it available for your project.

As you explore the Marketplace further, notice that there are more assets available beyond just data. For example, Mistral models, CodeLlama models, and many AI products from John Snow Labs models are all easily accessible through the Marketplace. We encourage you to explore further. Hopefully, you find something that enhances your projects!
