With that, we have the training dataset for the Favorita project. We save a snapshot of the training data to a table, to follow best practice and ensure we can train future models on the exact same data if we need to reproduce the project at any point. *Figure 6.10* shows the catalog view of our Favorita `training_data` table. Here, we have opened the Lineage tab of the table to see what data was used to build this training data.

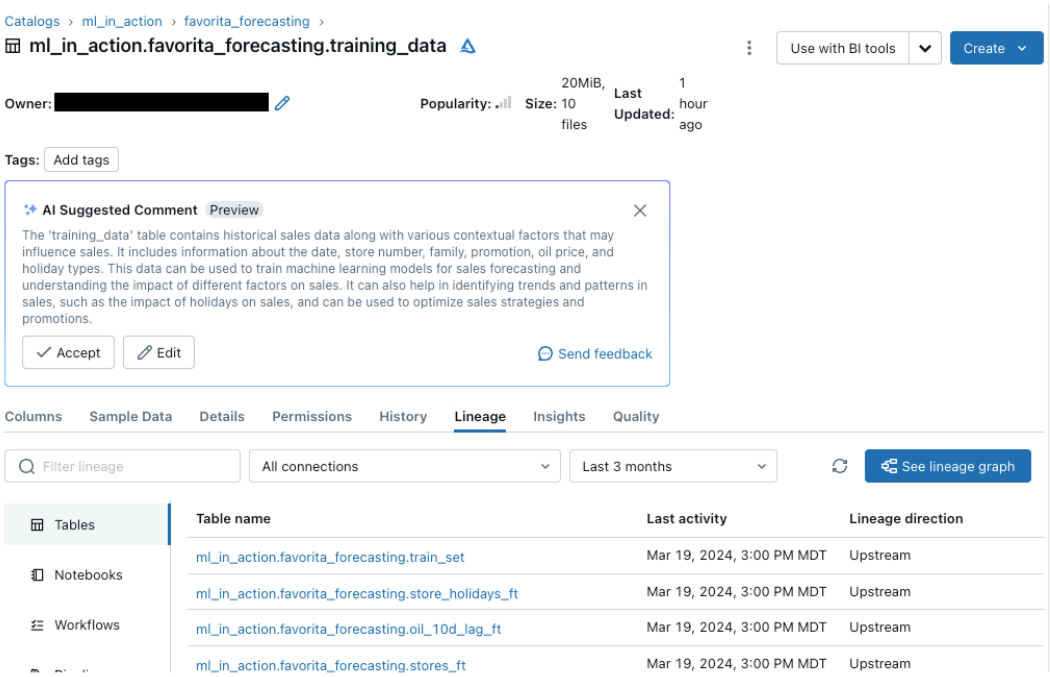

Figure 6.10 – The UI displaying the Lineage tab for the feature table in the Catalog

The Catalog pane is available by clicking the Catalog on the left side menu bar. Then search for the `ml_in_action` catalog. Select the `favorita_forecasting` database (also called a schema). In the list of tables (you may have to scroll), select the `training_data` table. Once you your screen matches *Figure 6.10*, click the **See lineage graph** button to see the lineage DAG, which takes us to something close to *Figure 6.11*.
