```
training_feature_lookups = [
    FeatureLookup(
      table_name="transaction_count_history",
      rename_outputs={
          "eventTimestamp": "TransactionTimestamp"
        },
      lookup_key=["CustomerID"],
      feature_names=["transactionCount", "isTimeout"],
      timestamp_lookup_key = "TransactionTimestamp"
    ),
    FeatureLookup(
      table_name="product_3minute_max_price_ft",
      rename_outputs={
          "LookupTimestamp": "TransactionTimestamp"
        },
      lookup_key=['Product'],

      timestamp_lookup_key='TransactionTimestamp'
    ),
    FeatureFunction(
      udf_name="product_difference_ratio_on_demand_feature",
      input_bindings={"max_price":"MaxProductAmount", "transaction_amount":"Amount"},
      output_name="MaxDifferenceRatio"
    )
]
```

Figure 6.16 – Creating training feature lookups

We combine the Feature Lookups and the Feature Function into a list to provide to the DFE client. Also note that we rename `LookupTimestamp` to `TransactionTimestamp` for the `product_3min_max_price_ft` table using the `rename_outputs` argument. This is because the timestamp column we want to key off of is present in our base DataFrame as `TransactionTimestamp`. Both feature tables use the point-in-time lookup functionality. We use point-in-time because, as a time series, we want the feature values that are the most recent relative to a given lookup timestamp. We do not want nulls when a timestamp doesn't match perfectly, and we certainly don't want information from the future sneaking into our training data. Implementing this product feature is as simple as adding a timestamp column as the `timestamp_lookup_key`.

Following the feature lookups, we build the `training_set` spec; see *Figure 6.17* for the code. The spec needs a base DataFrame, `raw_transactions_df`, that begins once the features have non-null values. We ensure we only have non-null values by using the max timestamp of the two minimums as mentioned previously. Looking at your SQL results, pick the max and copy the timestamp. Then paste it into place of the timestamp in *Figure 6.17*.
