Answers

After putting thought into the questions, compare your answers to ours.

1. It is important that MLflow is open-source because it is vendor agnostic, so you won't be locked into using a specific vendor or model. MLflow continues to develop and expand to support generative AI with the help of its robust open-source development community.
2. Baseline models are simple or common models you can use to learn valuable information about your data, such as if it contains salient features. You can also use baseline models to evaluate more complex ones. You can use AutoML to quickly build a baseline model.
3. You can use the Databricks Marketplace to incorporate external data artifacts, like datasets, notebooks, and models, into your own projects. You can also use the Databricks LLM Playground to experiment with Large Language Models within the platform. Using external data is useful when your project could benefit from data sources like weather, which might not be available internally. Incorporating LLMs via the Playground is beneficial to start experimenting rapidly without the typical development overhead.
