2. Click **Register model** in the top corner. This opens a dialogue box where you can register the model in the workspace or UC Model Registry. Of course, we want to use Unity Catalog. Selecting UC provides the code to register the model via API. This code is already included in the `CH7-01-Registering the Model` notebook. When running the notebook in your own workspace, you must update the `runs:/` URL in the notebook before executing it.

3. While still in your notebook, execute the final cell a second time. This creates a second version of the same model.
4. Navigate to the `favorita_forecasting` database in the Catalog. Selecting the **Models** tab opens a new UI, as shown in *Figure 7.10*.
