Project: Streaming Transactions

We have much to do to wrap up the streaming transactions project! We will build our model, wrap it, validate it, and implement batch inference. To accomplish this, we begin ingesting the labels into a different table. This allows us to set up the inference table and merge the actual labels after the predictions happen. We will create two workflows: **Production Streaming Transactions** and **Production Batch Inference** and Model Retraining.

As with any project, we refine previously written code as we work toward production. The notebooks that look familiar from earlier in the book may have some minor updates, but most of the code remains unchanged.

Before we jump in, let's remember where we are and where we are going with a quick look at the project pipeline in *Figure 7.13*.
