

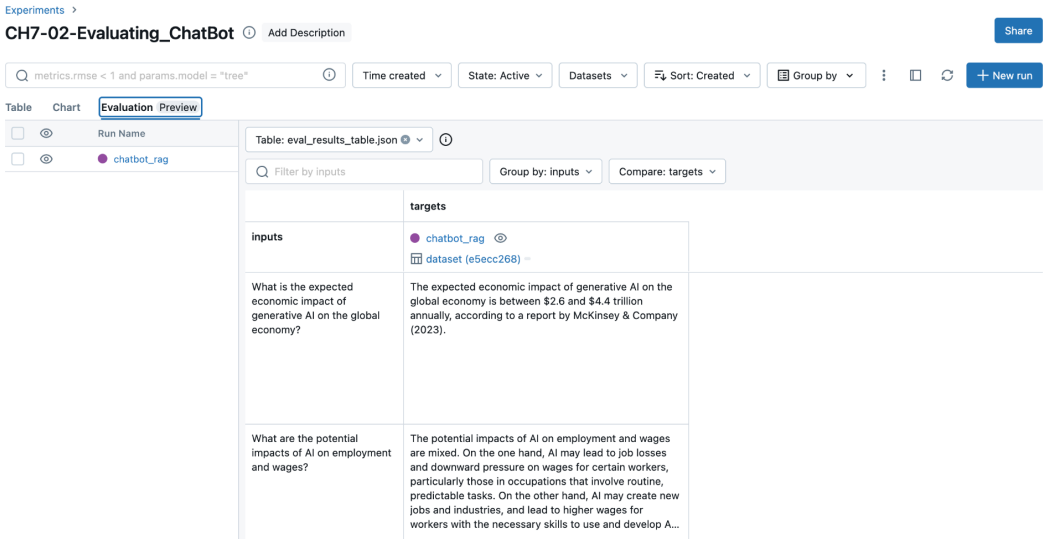

Figure 7.56 – Using the Evaluation view in Databricks MLflow

Take a look at a few examples from the evaluation dataset. We see that our model, according to a quick human assessment, is performing reasonably well. Of course, this form of evaluation is not scalable, so let's dig into the other metrics as well. We use the common visualization library `plotly` to take a closer look at our model results. First, we look at the distribution of token counts in our chatbot's responses.

```
import plotly.express as px
px.histogram(df_genai_metrics, x="token_count", labels={"token_count": "Token Count"}, title="Distribution of Token Counts in Model Responses")
```
