## Project: Retrieval-Augmented Generation Chatbot

The RAG Chatbot project will ingest PDF documents to build the knowledge base for the chatbot. We use a volume to store the PDFs. To follow along in your workspace, please open the following notebook:

- `CH2-01-Downloading PDF Documents`

Files can be uploaded to a volume directly in the Databricks console via the user interface, as shown in *Figure 2.26*; however, this project uses the code provided in the notebook to download and save the data to a volume programmatically.

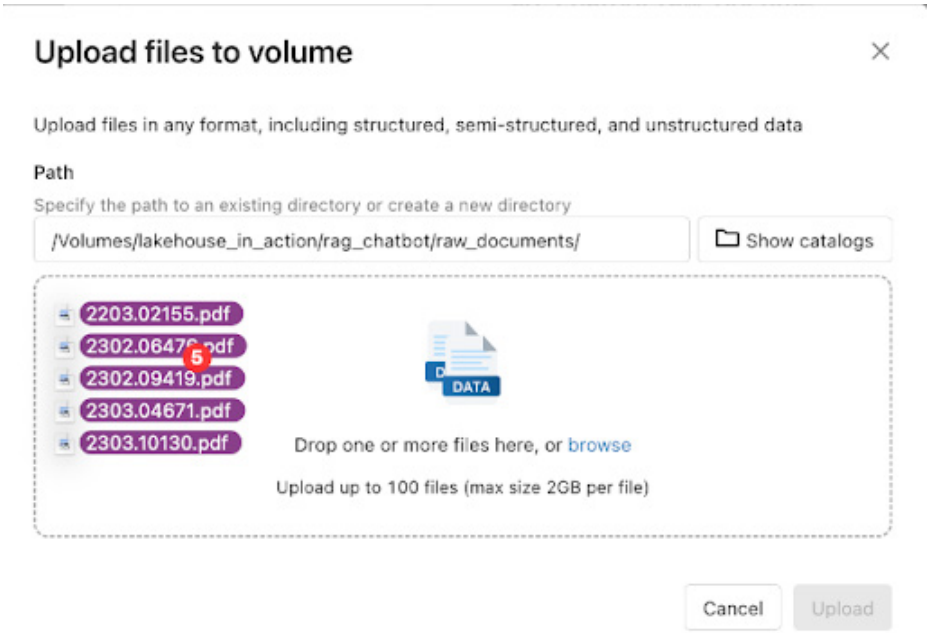

Figure 2.26 – Manually uploading documents into a volume

The code for this chapter begins with setup cells and helper functions, and in *Figure 2.27* we designate `library_folder` where we will save the PDFs we download.

```
library_folder = "{}/raw_documents".format(volume_file_path)

user_agent = "mlaction_book"
```
