Project: Streaming Transactions

In *Chapter 2*, you generated streaming transaction data. In this chapter, you build out the Bronze layer for the Streaming Transactions project. This is the raw data that you will clean, transform, and eventually use to train a machine learning model. We specifically created this streaming project to practice using Auto Loader, schema evolution, Spark Structured Streaming, and Delta Live Table features, so we'll use those throughout this part of the project. To follow along in your workspace, please refer to the following notebooks:

- `CH3-01-Generating Records and Schema Change`
- `CH3-02-Auto Loader and Schema Evolution`
- `delta_live_tables/CH3-03-Formatting to Delta with DLT`

Here's where you are in the project flow:
