```
def build_autoloader_stream():
  raw_data_location = spark.conf.get('raw_data_location')
  return spark.readStream.format('cloudFiles') \
      .option("cloudFiles.format", "json") \
      .option("cloudFiles.inferColumnTypes","true") \
      .option("cloudFiles.schemaEvolutionMode", "addNewColumns") \
      .option("cloudFiles.schemaHints","CustomerID bigint, Amount double, TransactionTimestamp timestamp") \
      .load(f"{raw_data_location}")
```

Figure 3.14 – The Auto Loader stream method details

Generating the bronze table in a DLT pipeline

The `generate_table()` function feeds our read stream created using Auto Loader into DLT. We use `spark.conf.get('variable_name')` to access the variable values we defined in the pipeline's Advanced settings (*Figure 3.13*). In the notebook, you will see the final step, a one-line cell called `generate_table()`. The function definition for `generate_table()` is in *Figure 3.15*.

```
def generate_table():
  table_name = spark.conf.get('table_name')
  @dlt.table(name=f'{table_name}',table_properties={"quality":"bronze"})
  def create_table():
    return build_autoloader_stream()
```

Figure 3.15 – Generating the Bronze table in a DLT pipeline

Back in the DLT UI, we save and click the **start** button. After the setup process, you will see a graph that includes our table. **Start** not only starts the pipeline but creates it as well. Once it finishes, you will have a screen like that shown in *Figure 3.1*.

Querying streaming tables created with DLT

You can query a streaming table created with DLT just like you query other tables. This is handy for populating dashboards, which we cover in *Chapter 8*.

> **Important note**
>
> If you are in a notebook, trying to query your streaming table and get this error:
>
> `ExecutionException: org.apache.spark.sql.AnalysisException: 403: Your token is missing the required scopes for this endpoint.`
>
> It is because to query streaming tables created by a Delta Live Tables pipeline, you must use a shared cluster using Databricks Runtime 13.1 and above or a SQL warehouse. Streaming tables created in a Unity Catalog enabled pipeline cannot be queried from assigned or no isolation clusters. You can change your cluster or use the DBSQL query editor.

The pipeline creates our Bronze table, wrapping up our learning applied to the Streaming Transaction data.
