Project: Favorita Store Sales - Time Series Forecasting

You downloaded the Favorita Sales Forecasting dataset from Kaggle using `opendatasets` in the last chapter. We will use that data now to create Delta tables. To follow along in your own workspace, please refer to the following notebook:

- CH3-01-Loading Sales CSV Data as Delta

You can **Run all** at the top of this notebook. We utilized the data profile capability (*Figure 3.16*) to check the data types before writing to a table. In cell 6, click the **+** to see the data profile. This lets us look at the data types and distributions quickly.

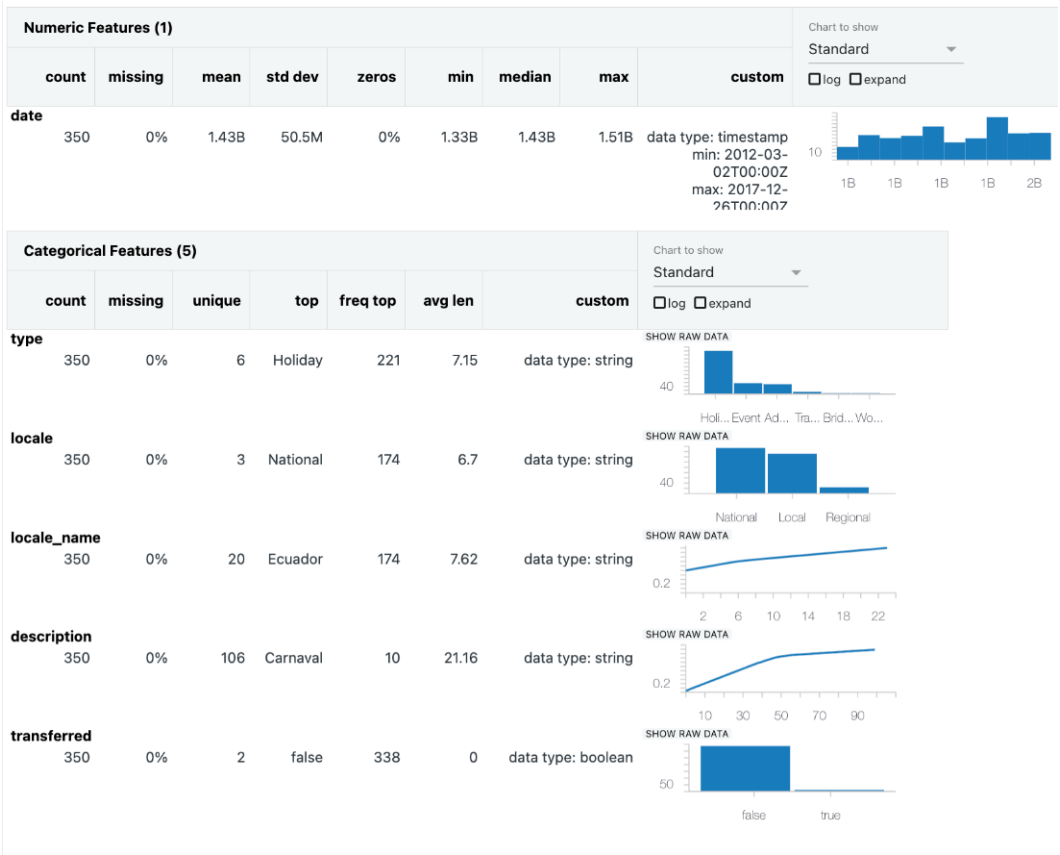

Figure 3.16 – Utilizing display(df), you can click the + to see the data profile. This lets us look at the data types and distributions quickly

Profiling shows the inferred data type for the date field is a string rather than a date or timestamp. Therefore, we alter the data type before writing to a Delta table.
