2. We disable Deletion Vectors because the `DeltaTorchReader` does not support Deletion Vectors yet (*Figure 3.33*).

```
%sql
ALTER TABLE delta.`/Volumes/ml_in_action/cv_clf/files/intel_image_clf/train_imgs_main.
delta` SET TBLPROPERTIES ('delta.enableDeletionVectors' = false);
ALTER TABLE delta.`/Volumes/ml_in_action/cv_clf/files/intel_image_clf/valid_imgs_main.
delta` SET TBLPROPERTIES ('delta.enableDeletionVectors' = false);
```

Figure 3.33 – Optimizing the training table

Note that the variables we saved in Python are inaccessible in SQL, so we hard-code them in this example. You could include SQL variables in the `global-setup` notebook to avoid this.

Now, we have the training and validation tables loaded and optimized to efficiently work with this image data for fine-tuning our multi-class computer vision models.

Summary

In this chapter, we focused on the essentials of building the Bronze data layer within the Databricks Intelligence Platform. Emphasizing the importance of schema evolution and the conversion of data into Delta format. We have applied these principles in our example projects. This chapter highlighted the advantages of Auto Loader and Delta Live Tables in the ETL process. Auto Loader, with its proficiency in handling file tracking and automating schema management, alongside DLT's robust capabilities in pipeline development and data quality assurance. Auto Loader and DLT are pivotal in our data management strategy. These tools facilitate an efficient and streamlined approach to data pipeline management, enabling us as data scientists to focus more on valuable tasks such as feature engineering and experimentation.

With our Bronze layer created, we now transition from this foundational work to the Silver layer. *Chapter 4, Getting to Know Your Data* will take us deeper into our data and demonstrate various Databricks tools that will aid us in tracking data quality, data exploration, and making our text machine explorable.

Questions

The following questions solidify key points to remember and tie the content back to your experience.

1. What are the names of the layers in the Medallion architecture design?
2. If you wanted to build a managed pipeline with streaming data, which product would you use, structured streaming or Delta Live Tables?
3. What feature did we use to add the product column to our Streaming Transaction data without manual intervention?
