As you saw in the previous chapter, CoffeeScript provides the convenience of classes by providing class syntax on top of objects and prototypes. How does CoffeeScript do that and what are the trade-offs? Read on to find out.

5.1.1. Raw data

Imagine that Agtron wants to open an online shop to sell digital cameras. Unsurprisingly, he has asked you to write the program to do that. Figure 5.1 demonstrates the shop homepage that he wants.

Figure 5.1. Agtron's shop homepage

Where to start? To sell the cameras, you'll need to know which cameras to sell and how many are in stock. Sample data containing this information has been supplied to you as an object:

```
data =
  X100:
    description: "A really cool camera"
    stock: 5
  X1:
    description: "An awesome camera"
    stock: 6
```
