When `Camera extends Product`, invoking `super` inside a method invokes the corresponding inherited method. Suppose that the markup on cameras is massive and they sell at twice the product cost:

```
class Product
  constructor: (name, cost) ->
    @name = name
    @cost = cost
  price: ->
    @cost

class Camera extends Product
  markup = 2

  price: ->
    super()*markup
```

Create a `Camera` and invoke the `price` method:

```
camera = new Camera 'X10', 10
camera.price()
# 20
```

You can use `super` with any method call, including a constructor. If you haven't overridden a method, then the same inherited method that `super` invokes will be invoked automatically via the prototype. The next listing shows an in-context use of `super` to call the `Product` constructor from the `Camera` constructor. As with other listings in this chapter, you can't run listing 5.5 from the REPL; you need to run it with listing 5.13.

Listing 5.5. Agtron's shop client application with camera gallery
