CoffeeScript) referring to the new object. In listings 5.6 and 5.7 the CoffeeScript class constructor corresponds to a constructor function in JavaScript.

Raw constructor functions still work in CoffeeScript:

Any object created using a function as a constructor has a `constructor` property that references the function. How about methods then? How do they work?

5.5.2. How methods work

The listing that follows shows the compiled JavaScript output for a CoffeeScript class with a constructor and one method.

Listing 5.7. CoffeeScript class, constructor, and method compilation

CoffeeScript

```
class SteamShovel
  constructor (name) ->
    @name = name
  speak: ->
    "Hurry up!"

gus = new SteamShovel
gus.speak()
#Hurry up!
```

JavaScript

```
var SteamShovel = (function() {
  function SteamShovel(name) {
    this.name = name;
  }
  SteamShovel.prototype.speak =
    function() {
   return "Hurry up!";
 };
 return SteamShovel;
  };
gus = new SteamShovel();
gus.speak();
```
