```
before = (decoration) ->
  (base) ->
    (params...) ->
      decoration.apply @, params
      base.apply @, params

after  = (decoration) ->
  (base) ->
    (params...) ->
      result = base.apply @, params
      decoration.apply @, params
      result

around = (decoration) ->
  (base) ->
    (params...) ->
      result = undefined
      func = =>
        result = base.apply @, params
      decoration.apply @, ([func].concat params)
      result
```

With this new version of `around`, the robots can move again:

```
bender = new Robot 3
bender.forward()
# start engine
# move
# stop engine
# 4

bender.forward()
# start engine
# move
# stop engine
# 5

bender.reverse()
# start engine
# move
# stop engine
# 4

bender.position()
# 4
```

It takes some time to get used to these programming concepts. At first, it’s best to lightly use techniques that you’re less familiar with, until you can
