This is very handy; you now essentially have named parameters that can be supplied in any order without needing an intermediate `options` parameter:

```
makeCompetition max: 5, sort: ->
# {max: 5, sort: [Function]}

makeCompetition sort: (->), max: 5
# {max: 5, sort: [Function]}
```

The named arguments can go in any order and the effect will be the same.

Although this is useful, you should think carefully before using destructuring and make sure you aren't making your program hard to read. These examples and the issue of readability are revisited later in this chapter.

7.2.4. Array destructuring expansion

Since CoffeeScript version 1.7, array destructuring also works with expansion. What does that mean? Suppose you have an array of competitors:

```
competitors = [
  { name: 'wildcats', points: 3 }
  { name: 'tigers', points: 1 }
  { name: 'taipans', points: 5 }
]
```

How do you get just the first team and the last team? Prior to CoffeeScript 1.7 you needed to name the `first`, `last`, and `middle`:

```
[first, middle..., last] = competitors
first
# { name: 'wildcats', points: 3 }

last
# { name: 'taipans', points: 5 }
```

Since 1.7, though, you can elide the `middle` and the result will be the same:
