```
[first, ..., last] = competitors
first
# { name: 'wildcats', points: 3 }

last
# { name: 'taipans', points: 5 }
```

This is another small way in which CoffeeScript syntax can help you focus on just the things that matter to you.

7.2.5. Exercises

Got the knack for destructuring? Try these exercises to find out:

- Given an array of numbers such as `[1,2,3,4,5,6]`, write a function that uses destructuring and a comprehension to reverse each subsequent pair of numbers in the array so that, for example, `[1,2,3,4,5,6]` becomes `[2,1,4,3,6,5]` and `[1,2,1,2,1,2]` becomes `[2,1,2,1,2,1]`.
- Suppose you've received some JSON containing a phone directory in a format like this:

  ```
  {"A":[{"name":"Andy", "phone":"5551111"},...],"B":[...],...}
  ```

  Write a function that produces the last phone number for a given letter found in the phone directory.

7.2.6. Putting it together

Now that you've completed some exercises, it's time to see this new syntax in a program. Rest and spread parameters and destructuring techniques for arrays and objects are demonstrated in the competition program of the following listing. This listing is intended to run in a web browser; you can use the server from listing 7.5 to achieve that.

Listing 7.2. Competition with module pattern
