In the next listing you once again see the competition rankings program. This time the null soak is used to handle `null` values in the supplied data and when rendering an HTML view. This listing is intended to run in a web browser; you can use the server from listing 7.5 to achieve that.

Listing 7.3. Using null soak in a view

```
makeCompetition = ({max, sort}) ->
  render = (team) ->
    """
    <tr class='#{team?.name||''}'>
    <td>#{team?.name||''}</td>
    <td>#{team?.points||''}</td>
    <td>#{team?.goals?.scored||''}</td>
    <td>#{team?.goals?.conceded||''}</td>
    </tr>
    """

  find = (name) ->
    document.querySelector ".#{name}"

  color = (element, color) ->
    element.style.background = color

  insert = (teams...) ->
    root = document.querySelector '.teams'
    for team in teams
      root.innerHTML += render team

  highlight = (first, rest...) ->
    color find(first.name), 'gold'
    for team in rest
      color find(team.name), 'blue'

  rank = (unranked) ->
    unranked.sort(sort).slice(0, max).reverse()
```

The view is just a lo-fi function called render. Notice how the nulls are soaked in expressions such as team?.goals?.scored and that the default operator is used to output an empty string as the default value.
