```
  initialize: (unranked) ->
    ranked = rank unranked
    insert ranked...
    first = ranked.slice(0, 1)[0]
    rest = ranked.slice 1
    highlight first, rest...

sortOnPoints = (a, b) ->
  a.points > b.points

window.onload = ->
  competition = makeCompetition max:5, sort: sortOnPoints
  competition.initialize [
      name: 'wolverines'
      points: 56
      goals:
        scored: 26
        conceded: 8
    ,
      name: 'wildcats'
      points: 53
      goals:
        scored: 32
        conceded: 19
    ,
      name: 'mongooses'
      points: 34
      goals:
        scored: 9
        conceded: 9
    ,
      name: 'raccoons'
      points: 0
  ]
```

The competition is initialized as before except that now the data has information about the goals scored by individual teams.

The raccoons were disqualified so they have zero points and don't have a goals property.

Remember what the type of `null` is?

```
typeof null
# null
```

There's only one thing with a type of null and it's the `null` value. As mentioned previously, there are languages with rich and powerful type systems. CoffeeScript isn't one of them, and types, including the null type, can be problematic.

7.4. No types—the duck test
