CoffeeScript is dynamically and weakly typed. The most noticeable thing about the `typeof` operator so far in your CoffeeScript travels should be its absence. When writing programs in CoffeeScript, there's rarely any benefit to be gained from examining types by using the `typeof` operator. Instead, use a technique called duck typing:

```
class Duck
  walk: ->
  quack: (distance) ->

daffy = new Duck
```

What can you do with a duck? You might put it on a leash and take it for a walk:

```
daffy.walk()
```

If it meets another duck, they might talk to each other:

```
donald = new Duck

donald.quack()
daffy.quack()
```

That's great. Suppose you want to organize a duck race:

```
class DuckRace
  constructor: (@ducks) ->
  go: ->
    duck.walk() for duck in @ducks
```

This `DuckRace` doesn't know if only ducks are competing. For example, a faster animal such as a hare could enter the race:

```
class Hare
  run: ->
  walk: -> run()

hare = new Hare

race = new DuckRace [hare]
```
