That’s unfair! How will you prevent non-ducks from entering the race? If you have experience in a strongly typed language, then you might think that the `typeof` operator will do the trick.

7.4.1. Don’t rely on typeof, instanceof, or constructor

You want to be strict with entrants to the `DuckRace` and ensure that they’re all real, certified ducks, and your first thought is to use the `typeof` operator. Unfortunately, the `typeof` operator in CoffeeScript isn’t very useful:

```
daffy = new Duck
typeof daffy
# 'object'
```

Almost everything in CoffeeScript is an object, so there’s really no point using `typeof` here. So, you think that perhaps you can test to see if the object was created from the `Duck` class by using the `instanceof` operator:

```
daffy instanceof Duck
# true
```

Great, that’s a duck. Is `instanceof` the solution? No. What happens when you change the `DuckRace` constructor to admit any objects that are `instanceof Duck`?

```
class DuckRace
  constructor (applicants) ->
    @ducks = d for d in applicants when d instanceof Duck
  go: ->
    duck.walk() for duck in @ducks
```

The race is run. Unfortunately, one of the ducks isn’t really a duck. It was a duck, but it was turned into a snake by an evil warlock:
