This is useful for object parameters, but in most other cases you should avoid arguments on newlines.

Fluent interfaces without parentheses

The minimalist inside you thinks that a fluent interface with parentheses seems wasteful and looks exactly like the equivalent JavaScript:

```
turtle
.forward(3)
.rotate(90)
.forward(1)
```

The good news is that if you're using CoffeeScript 1.7 or later, the compiler will recognize fluent interfaces with parentheses omitted so that the same expression without the parentheses has the same result:

```
turtle
.forward 3
.rotate 90
.forward 1
```

Since CoffeeScript 1.7 the preceding code will compile to the following JavaScript:

```
turtle.forward(2).rotate(90).forward(4);    <-- Compiled JavaScript
```

As long as you keep the indentation consistent, you can pick whichever indentation level you prefer, and the compiler will close the parentheses on fluent call chains for you, so the following also works:

```
turtle
  .forward 3
  .rotate 90
  .forward 1
```

You can think of the dot on the newline as closing all and only implicit calls. It does not close other function calls:
