Suppose you have a function that returns an array of objects containing information about your friends. It's tempting to leave out all the squiggly braces and end up with something like this:

```
friends = ->
    name: 'Bob'
    address: '12 Bob Street Bobville'
  ,
    name: 'Ralph'
    address: '11 Ralph Parade Ralphtown'
```

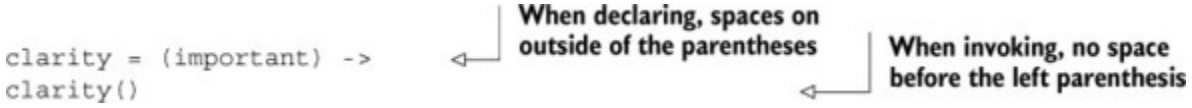

Sometimes, though, including the square and squiggly brackets makes it easier to read:

```
friends = ->
  [{
    name: 'Bob'
    address: '12 Bob Street Bobville'
  },
  {
    name: 'Ralph'
    address: '11 Ralph Parade Ralphtown'
  }]
```

This might not seem to be in the spirit of CoffeeScript, but the general rule should be that if you need to look at the compiled JavaScript to figure out if your CoffeeScript syntax is correct, then there's a good chance it's ambiguous. How about those parentheses?

Only function declaration parentheses have spaces

When invoking a function, there should be no space before the first parenthesis. No.Space.Ever! Although many syntax questions are a matter of taste, this one is not:

When invoking a function, having no parentheses or putting them around the outside works fine:
