```
withEvents = (emitter, event) ->
  pipeline = []
  data = []

  reset = ->
    pipeline = []
    run = ->
      result = data
      for processor in pipeline
        if processor.filter?
          result = result.filter processor.filter
        else if processor.map?
          result = result.map processor.map
      result

    emitter.on event, (datum) ->
      data.push datum

    filter: (filter) ->
      pipeline.push {filter: filter}
      @
    map: (map) ->
      pipeline.push {map: map}
      @
    drain: (fn) ->
      emitter.on event, (datum) ->
        result = run()
        data = []
        fn result
    evaluate: ->
```

A drain runs each event through the filters and maps and invokes a callback.
