organizations can publish read/write JSON APIs or make their entire data sets accessible to the world of JavaScript.

Monsur Hossain is fellow Googler and expert in cross-domain JavaScript communication. He and I first crossed paths working on Google's XML-based Data APIs and later as engineers on Google's JavaScript client library. Over the years, Monsur lead many facets of the client library, including its OAuth authentication flow and adding CORS support for APIs like YouTube and Google Drive.

CORs in Action is a well-rounded resource for developers wanting to learn the entire spectrum of CORs. Monsur does an excellent job of covering the basics. He highlights important sections with figures and provides excellent code snippets to teach by example.

I particularly like how often Monsur references the browser DevTools. It's a critical tool for gaining insight into the browser's network stack. His use of real-world APIs like Google Calendar and Flickr also give readers practical hands-on experience. I have no doubt you'll walk away learning a great deal from *CORs in Action*.
